Pediatric Surgery

The Pediatric Surgery department at Valley Children's specializes in the repair of birth defects and acquired conditions in infants, children and adolescents. Surgeons perform about 3,500 pediatric surgeries a year and more than 200 different surgical procedures, some common and others rare.

Conditions treated include:

- Pectus deformities (excavatum and carinatum)
- Congenital anomalies requiring surgery (gastroschisis, diaphragmatic hernia, atresia)
- Hernias
- Lung and chest masses, cysts
- Blood disorders requiring splenectomy
- Hepatobiliary disease (biliary atresia, choledochal cyst, gallbladder disease, tumors)
- Gastroesophageal reflux disease, feeding disorders requiring gastrostomy
- Anorectal and colon malformation (Hirschsprung's disease, imperforate anus, fecal incontinence)
- Head and neck masses, lumps and bumps
- Tumors (neck, chest, abdomen, endocrine)

Procedures are performed on an inpatient, outpatient and emergency basis. A high volume of both inpatient and surgical cases, combined with diverse training from national centers of excellence, give our surgeons a level of experience not found elsewhere in our region. Our physicians' expertise means a lot to our patients and their families. Often our patients experience shorter lengths of stay and better outcomes. Whenever possible our surgeons use less invasive surgical techniques (i.e., laparoscopies with small incisions), adopting nationwide best practices and providing compassionate care through multidisciplinary teams that have broad experience with children. We also offer minimal blood loss techniques whenever appropriate. General pediatric surgeons work closely with the Hospital's subspecialists and subspecialty surgeons.

Pediatric Surgery Consultant Reference Guide

A pediatric surgeon has completed a five-year residency in general surgery, plus a two-year fellowship in pediatric surgery, and is certified by the American Board of Surgery in both general and pediatric surgery.

The following patients should be referred to a pediatric surgeon:

Infants and children with perforated appendicitis should be cared for by a pediatric surgeon. If a non-pediatric surgeon makes the diagnosis or suspects the diagnosis of perforated appendicitis in a child, the child should be transferred to the care of a pediatric surgeon.

Infants, children, and adolescents with solid malignancies should be cared for from the outset by a pediatric surgeon or pediatric surgical specialist and a pediatric medical cancer specialist.

Minimally invasive procedures (e.g., laparoscopy, thoracscopy) in infants and children should be performed by a pediatric surgeon trained in these techniques.

Infants and children with medical conditions that increase operative risk (e.g., congenital heart disease) who must undergo a common surgical procedure (e.g., hernia repair) should be cared for by a pediatric surgeon.

Valley Children's HEALTHCARE

Pediatric Surgery Consultant Reference Guide

Condition	Pre-referral Work-up	When to Refer
Appendicitis	• CBC • CRP	Send to Emergency Department as soon as possible
Dermoid Cyst	• History and physical • If there is a concern of deep involvement on the face, orbit or scalp, CT or other imaging	If it becomes painful, inflamed, changes in color or size or becomes a cosmetic issue If located on face, refer to Plastic Surgery
Gallstones	• History and physical examination • Ultrasound/HIDA w/ GB PDSC • Liver function studies	Positive physical findings or scan
GER	• H2 blocker • PPI • UGI, swallow study, pH probe study, endoscopy	Secondary referral after Gastroenterology consult
Umbilical Hernia	• History and physical	If persistent in a child > 4 years old or in a younger child with a large (>2cm) defect or proboscis type hernia Refer to Emergency Department if incarceration is suspected
Epigastric Hernia	• History and physical	Positive physical findings

Valley Children's HEALTHCARE

Pediatric Surgery Consultant Reference Guide

Condition	Pre-referral Work-up	When to Refer
Inguinal Hernia	• History and physical	Refer to Emergency Department if incarceration is suspected Urgent referral if child is < 6 months old Routine referral if child is > 6 months old
Communicating Hydrocele	• History and physical	Treat as inguinal hernia using above guidelines
Hydrocele	• History and physical	Routine referral to surgery if persisting beyond 1 year of age
Pectus Carinatum/Excavatum	• History and physical • R/O connective tissue or genetic disorder (e.g., Marfan's syndrome) • CT / PFT / ECHO	If patient is in distress or as indicated by imaging Upon family request Pre-adolescence
Perirectal/Perianal Abscess	• History and physical	Refer if patient experiences recurrent episodes or persistent drainage
Pyloric Stenosis	• History and physical • Serum electrolytes • Ultrasound	Send to Emergency Department as soon as possible
Sacrococcygeal Pilonidal Disease	• History and physical	Refer if symptomatic
Cryptochordism or Undescended Testes	• History and physical • Ultrasound	Positive physical findings or scan

Pediatric Surgery Consultant Reference Guide

Condition	Pre-referral Work-up	When to Refer
Prenatal Anomaly - Fetal Diagnosis • **Abdominal wall defect** • **Intestinal obstruction** • **Diaphramatic defects** • **Chest mass** • **Conjoined twins** • **Choledoeal cyst or biliary disorders** • **Oranan cysts**	• Maternal - Fetal perinatal evaluation and high resolution fetal ultrasound • Amniocentesis results or karyotype, if known	Positive physical findings or scan
Infant Ovarian Cyst	• History and physical • Abdominal and pelvic ultrasounds	Positive physical findings or scan
Lymphadenopathy	• History and physical (including antibiotic history) • PPD or other skin testing	Positive physical findings or scan
Fecal Incontinence	• History and physical (including prior surgical intervention)	Positive finding for anorectal malformation (imperforate anus) or Hirschsprung's disease Approaching school age and still in diapers during the day
Skin and Soft Tissue Masses • **Dermoid / sebaceous cyst** • **Pilomatrixoma** • **Lipoma** • **Vascular malformation (not on face)**	• History and physical (including antibiotic history) • Photographs if vascular lesion	Positive physical findings Suspected malignancy Vascular lesion
Head and Neck Masses • **Brachial cleft anomaly** • **Thyroglossal duct cyst**	• History and physical	Positive physical finding
